Signature of Lab I/C

### START WRITING FROM HERE:

Aim: To design low pass RC and high pass RC junction filter circuit conditions & verify their response from a square wave i/p of given i/p Frequency.

### Equipment Needed :-

- Trainer Kit
- personal computer
- connecting wires
- Resistor - 100K $\Omega$
- Capacitor - 0.1uf, 0.01uf, 0.001uf

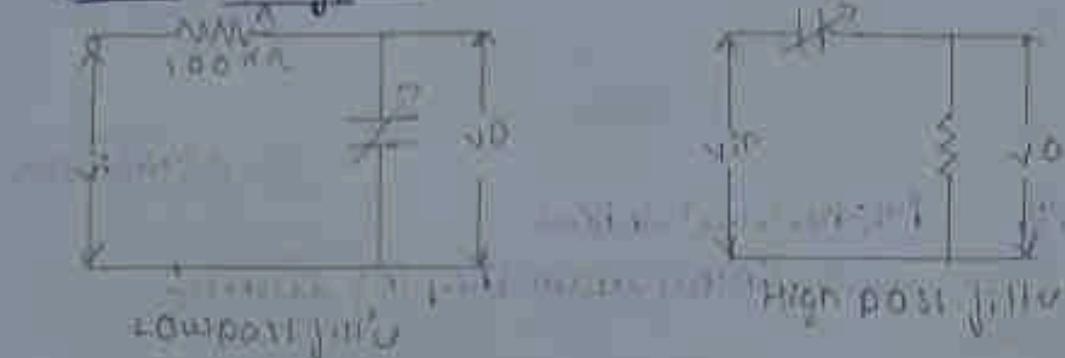

### Software Required:-

- waveform generation software
- multisim software

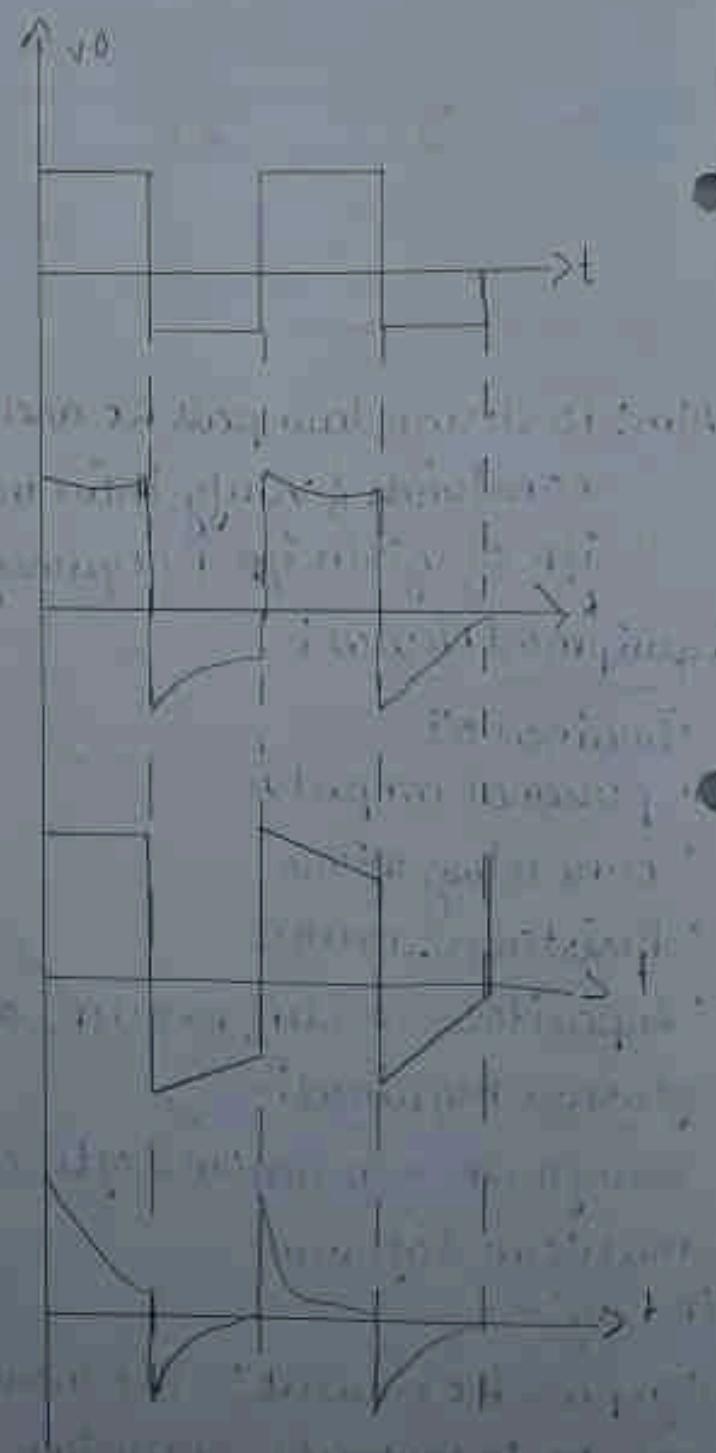

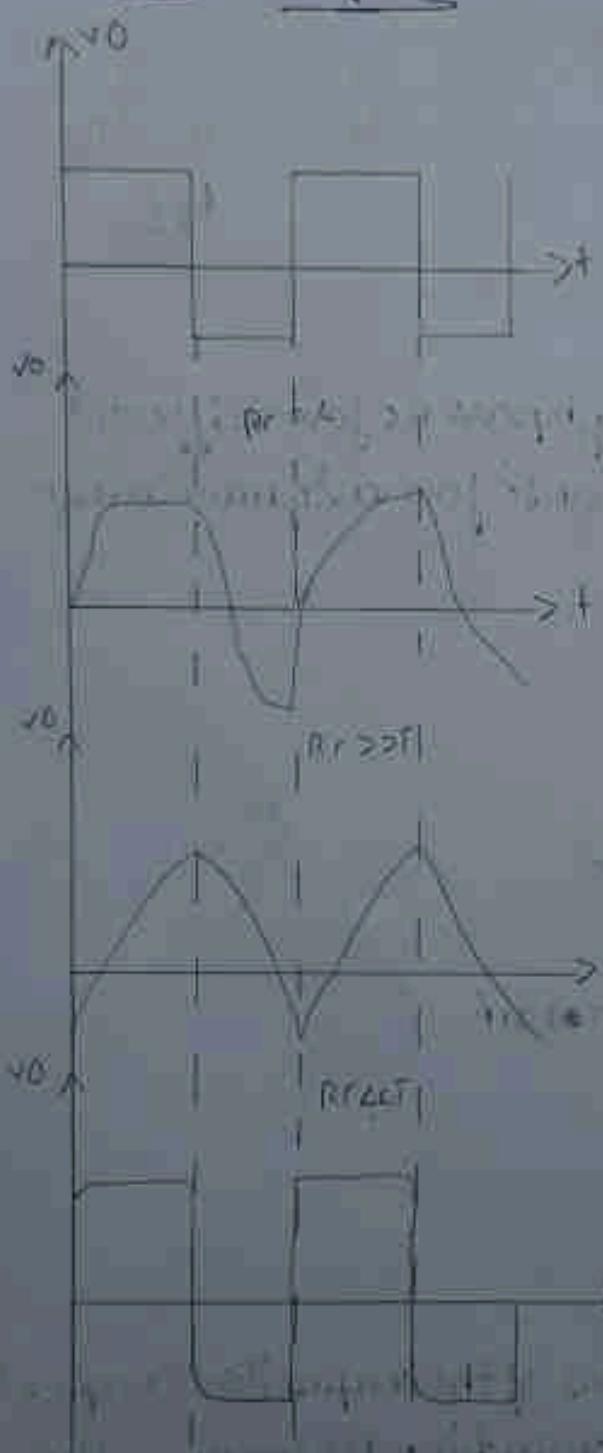

### Theory:-

High pass RC circuit: - The reactance of the capacitor depends upon the frequency of operation. At very high frequency the

## \* Circuit diagram \*

## \* Expected waveform \*

the reactance of the capacitor is zero. Hence the capacitor acts as short circuit. As a result the entire input appears at the capacitor in infinite so the capacitor acts as open circuit. Hence no input reaches the output. Since the circuit allows only high frequencies therefore it is called as high pass circuit.

Low pass circuit: The reactance of the capacitors depends upon the frequency of operations. At very high frequencies the reactance of the capacitor is 0. Hence the capacitor acts as s.c. As a result the o/p will fall to 0. At low frequencies the reactance of the capacitor is infinite. So the capacitor acts as dc. As a result the entire i/p appears at the output since the circuit allows only low frequencies. Therefore it is called as low pass circuit.

### \* Procedure \*

- Connect the circuit as per circuit diagram.
- Apply the square wave input to the circuit  $V_p = 10\text{V}_{p-p}$   
 $f = 1\text{KHz}$
- Calculate the time constants of the circuit by connecting one of the capacitor provided.
- Observe the o/p waveform for different input frequencies as shown in tabular column for different time constants.

## \*Tabular column\*

| R              | C        | $\tau_{RC}$ | Parallel time period | Condition        |
|----------------|----------|-------------|----------------------|------------------|
| 100 k $\Omega$ | 0.01 MF  | 0.01 sec    | 100 sec              | $R < 2\tau_{RC}$ |
| 100 k $\Omega$ | 0.01 MF  | 0.01 sec    | 100 sec              | $R = \tau_{RC}$  |
| 100 k $\Omega$ | 0.001 MF | 0.1 sec     | 10 sec               | $R > 2\tau_{RC}$ |

| R              | C        | $\tau_{RC}$ | Parallel time period | Condition        |
|----------------|----------|-------------|----------------------|------------------|
| 100 k $\Omega$ | 0.1 MF   | 0.01 sec    | 100 sec              | $R < 2\tau_{RC}$ |
| 100 k $\Omega$ | 0.01 MF  | 0.1 sec     | 10 sec               | $R = \tau_{RC}$  |
| 100 k $\Omega$ | 0.001 MF | 1 sec       | 1 sec                | $R > 2\tau_{RC}$ |

Calculations:-

Theoretical time period:-

$$T = RC$$

$$(i) R = 100k, C = 0.1MF$$

$$T = 100 \times 10^3 \times 0.1 \times 10^{-6}$$

$$= 0.01sec$$

$$(ii) R = 100k, C = 0.001MF$$

$$T = 100 \times 10^3 \times 0.001 \times 10^{-6}$$

$$= 0.1sec$$

$$(iii) R = 100k, C = 0.01MF$$

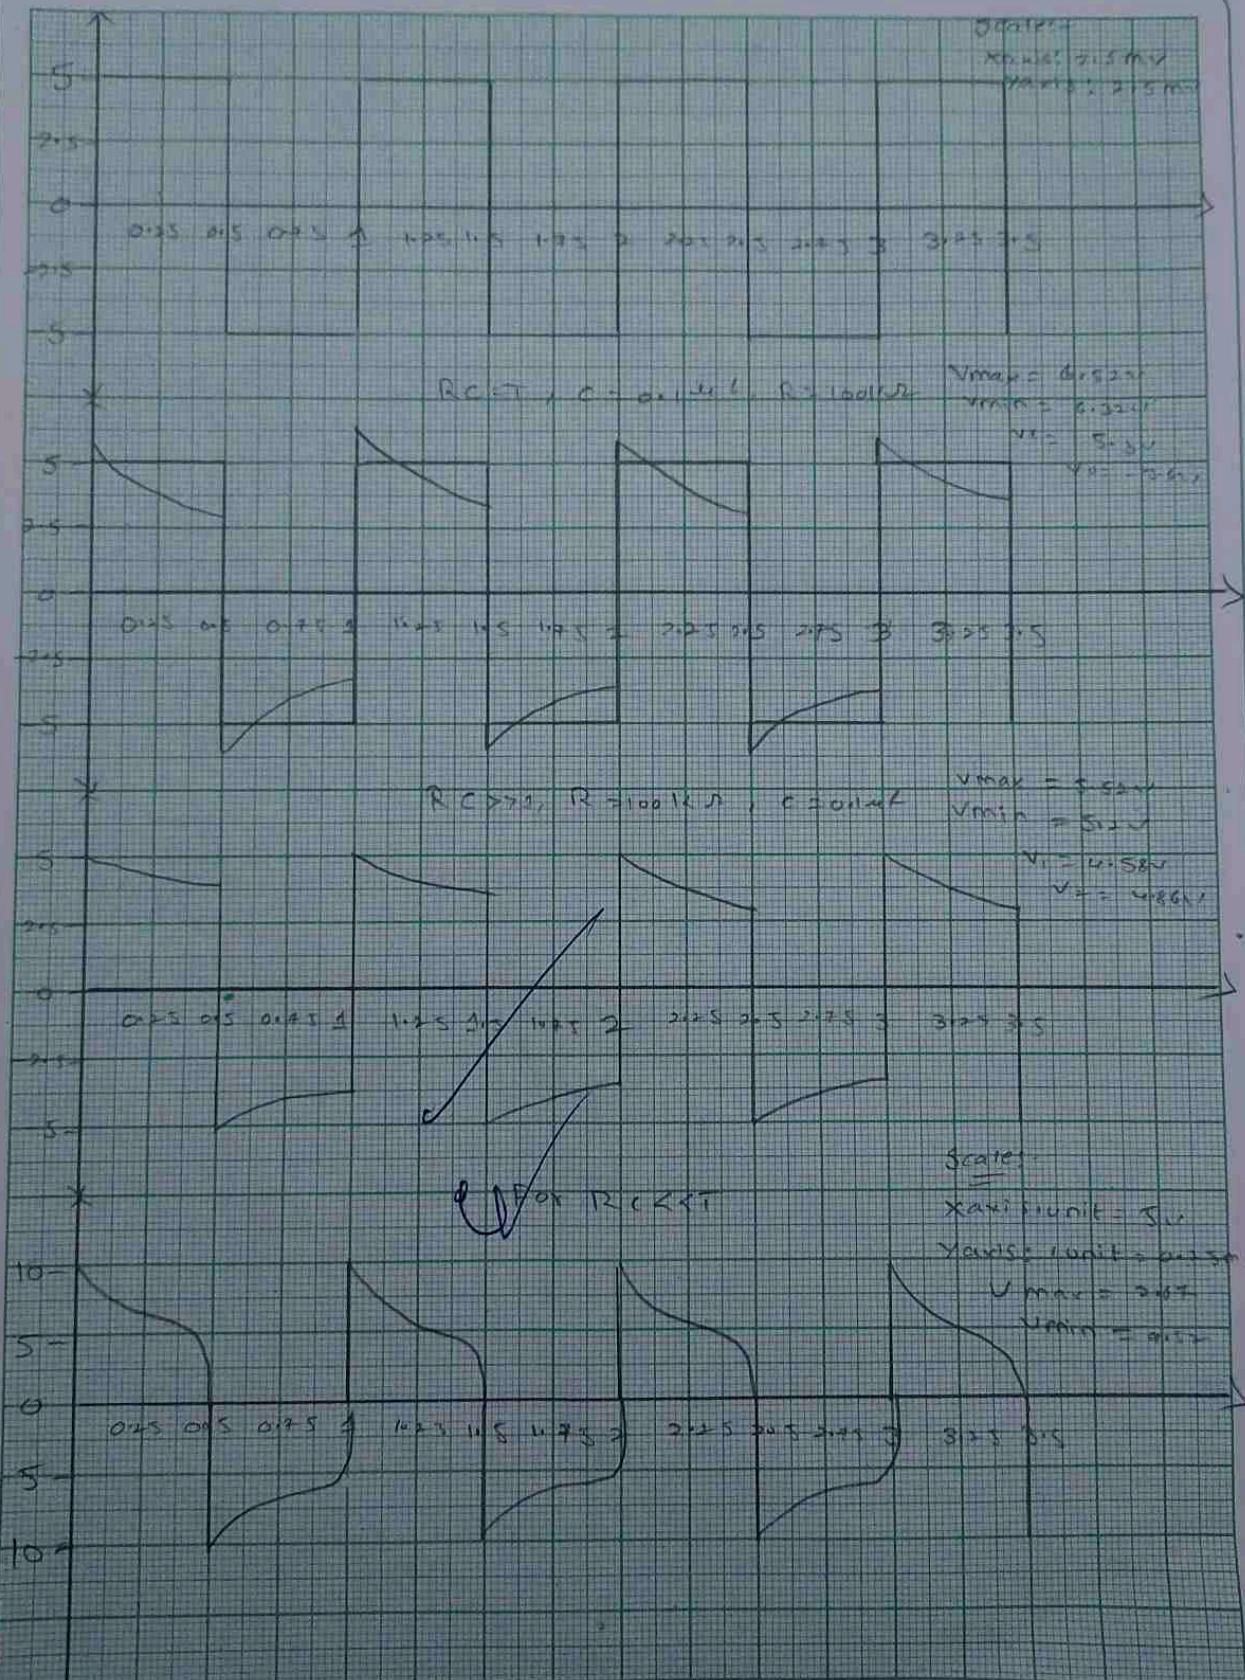

$$T = 100 \times 10^3 \times 0.01 \times 10^{-6}$$

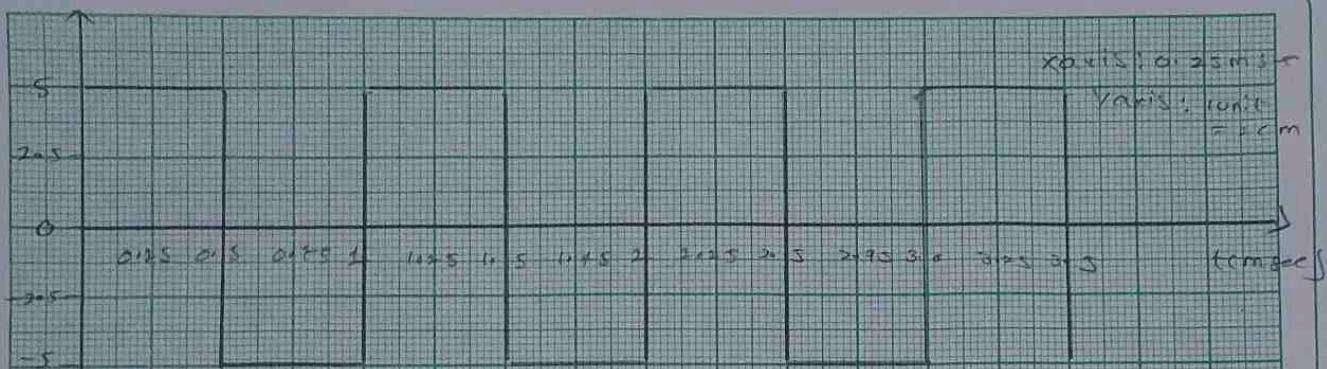

$$= 1ms$$

\*Result\*

Hence, designed the low pass high gain RC circuit and observed the output waveform.

### High Pass Filter RC circuit

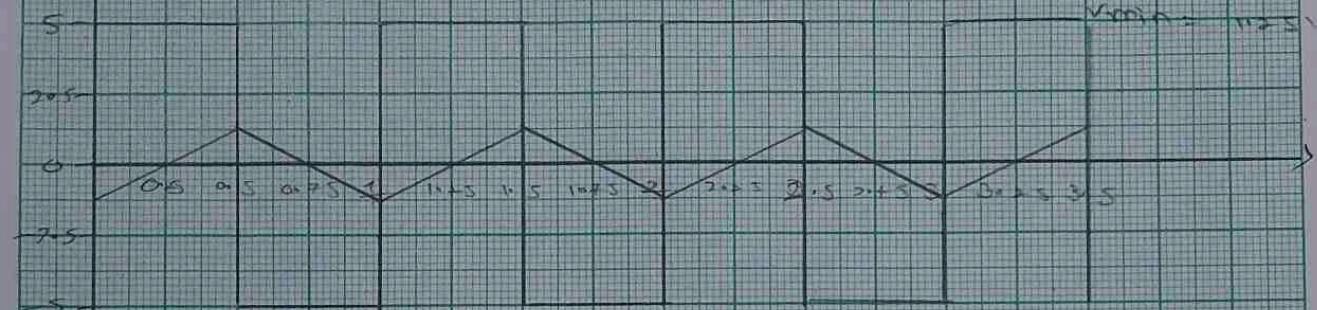

\* FOR  $R_C = T$ ,  $R_C = 100\text{k}\Omega$ ,  $C = 0.1\mu\text{F}$

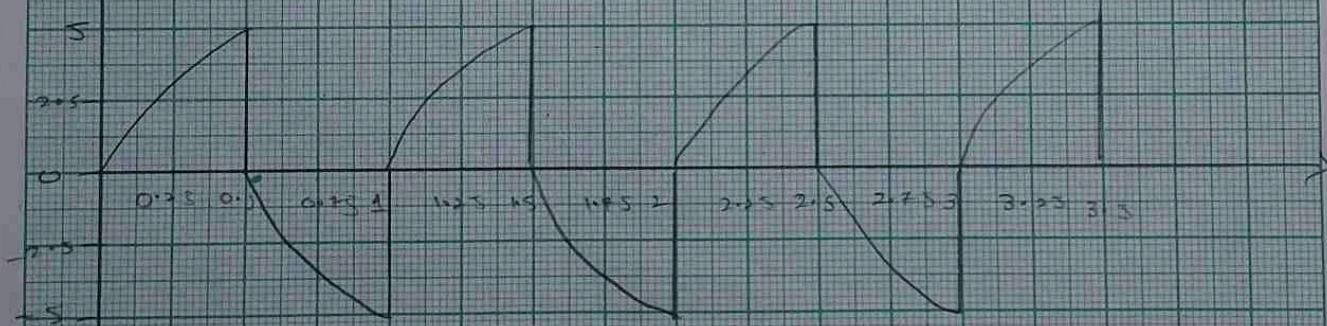

$$V_{\text{max}} = 1.3 \text{ V}$$

$$V_{\text{min}} = -1.2 \text{ V}$$

\* FOR  $R_C \ll T$ ,  $R = 100\text{k}\Omega$ ,  $C = 0.1\mu\text{F}$   $V_{\text{max}} = 4.5 \text{ V}$

$$V_{\text{min}} = -4.5 \text{ V}$$

\* FOR  $R_C \gg T$ ,  $R = 100\text{k}\Omega$ ,  $C = 0.1\mu\text{F}$  Xaxis: 1 unit

Yaxis: 1 unit

$$V_{\text{max}} = 1.66$$

$$V_{\text{min}} = -1.33$$
